

Abstract of the Disclosure

5        Intermediate or radio frequency signals are band pass  
      filtered by two band pass filters having identical frequencies,  
      but 90 degree relative phase shifts at the output, with a  
      reduced sampling rate. The outputs of the two BPFs represent in-  
      phase (I) and quadrature-phase (Q) baseband signals needed for  
10      demodulation.
